I'm a Full-Stack TypeScript Engineer and technical leader with 15 years of commercial software development experience. I specialize in greenfield applications, built from scratch and taken through to production. I'm now developing my own projects in AI Engineering & Automation, connecting AI agents with APIs, data and delivery workflows.

I enjoy owning the whole process: understanding the problem, designing the architecture, building a working version and improving it with users. As a Software Architect, Tech Lead and Team Lead, I have combined hands-on coding with technical direction, mentoring and delivery.

[Vibe iOS app](#) is my vibe coding platform for creating iOS apps from a prompt. I built the workflow that connects a web form and Supabase with GitHub repository provisioning, a Copilot coding agent, automated builds and TestFlight delivery. Users can describe an app, try it on their iPhone and continue developing it through the generated repository. The project link includes an invitation to try the flow.

[AI Email Router](#) automates message classification and routing to the right department. I built a Next.js, React and TypeScript application with editable routing rules, tool calling, SMTP integration and a live visualization, alongside the original [Python implementation](#) using Pydantic AI. Both use models served through Ollama.

[ChatRAG](#) is my RAG chatbot for uploaded documents and images. I built its Python engine with FastAPI, LangChain and ChromaDB for indexing files, retrieving relevant content and answering questions. The application also provides summaries and suggested prompts, with Vue.js, Node.js, PostgreSQL and GCP handling the wider product.

My core stack is TypeScript, Node.js and Vue.js, with PostgreSQL, MongoDB, Redis, event-driven systems, Docker, GCP and AWS. I use AI coding agents for implementation, refactoring, debugging and code review, and have helped a QA teammate adopt automation and AI-assisted workflows to grow into a QA Engineer role.

I'm interested in applying this combination of software engineering and practical AI automation at Interlogis: understanding an operational problem, integrating with existing systems and delivering a tool people can actually use. I value short feedback loops, maintainable code and clear business outcomes.
