

Aleksander Figiel

Tech Lead | Software Architect | Full-Stack TypeScript Engineer

Warsaw, Poland | olek.figiel@gmail.com | linkedin.com/in/AleksanderFigiel | github.com/feegloo

I'm a Full-Stack TypeScript Engineer and technical leader with 15 years of commercial software development experience, specializing in greenfield applications built from scratch. I also develop my own AI automation projects, using LLMs and tool calling to automate email routing and build RAG-based document tools. I have worked as a Software Architect, Tech Lead, Team Lead, and Senior Software Engineer, designing architectures, building critical parts of production systems hands-on, leading teams, mentoring engineers, and owning delivery from requirements to production.

My core stack is TypeScript, Node.js, and Vue.js, with experience in PostgreSQL, MongoDB, Redis, event-driven systems, GCP, and AWS. I focus on maintainable architecture, code quality, developer experience, and practical business outcomes.

Alongside my general software engineering work, I have been expanding into AI Engineering. As personal projects, I built [chatrag.app](#), an AI-powered RAG application for uploaded PDFs and images using Vue.js, Node.js, Python, LangChain, ChromaDB, PostgreSQL, and GCP. I also built [agent-email-router-next](#), a Next.js, React, and TypeScript application with an interactive visualization of AI email routing, alongside its original Python implementation, [agent-email-router](#), built with Pydantic AI. Both use local models through Ollama and agent tool calling to classify messages and route them to the appropriate department.

I also use AI coding agents in software development for implementation, refactoring, debugging, and code review. In addition, I have experience with AI enablement and mentoring - including helping a teammate progress from a QA Tester role toward a more technical QA Engineer role by adopting automation-oriented and AI-assisted workflows.

I'm interested in roles where I can contribute as an experienced software engineer and technical leader, whether the position is focused on traditional product engineering, architecture, or AI-enabled systems. I bring a strong software engineering foundation and can apply AI where it provides real value without making it a requirement for the role.
